

Presenting on LED · Preparing Your Content

INTERIOR: STAGE RIGHT · STAGE LEFT · IMAG | EXTERIOR: ARCH SCREEN

LED walls are not projectors or laptop monitors — they are grids of individual light-emitting pixels. Content that looks crisp on your screen can shimmer, thin out, or disappear on LED. Follow this guide and your presentation will look exactly as intended.

NO CLOUD PLAYBACK

BEFORE YOU ARRIVE

- **Bring your own adapters.** USB-C or Mini-DisplayPort to HDMI — we connect via HDMI only.
- **Save content locally.** Downloads, streaming, and cloud-linked media are not permitted for playback — venue connectivity cannot be guaranteed during show conditions.
- **Embed or outline all fonts** in your deck so type renders identically on any machine.
- **Disable sleep, notifications, and auto-updates** on the playback device.
- **Bring a backup** — a copy of the presentation on a USB drive is strongly recommended.
- **Arrive for your technical check.** A device check with our team is required before doors / event start.

DESIGNING FOR LED

DO

- Use **bold, high-contrast type** — medium weights and heavier.
- Keep body text at a minimum of **24pt equivalent at 1080p**; bigger is always better.
- Favor **dark backgrounds with light text** — it reads cleaner and cooler on LED.
- Leave generous margins — keep critical text away from screen edges.
- Use simple, high-contrast imagery with a clear focal point.

AVOID

- **Thin or light font weights** — strokes fall below pixel size and break apart.
- **Fine hairlines, delicate serifs, and small drop shadows** — they shimmer on the pixel grid.
- **Pure white full-screen backgrounds** — they bloom and overpower the room.
- Busy photos or gradients behind small text.
- Tightly packed slides — one idea per slide reads best at distance.

DAY OF EVENT

- **Arrive 4 hours before the event.** Early arrival is required for signal routing, device configuration, and a full playback check under show conditions.
- Our team provides the connection point, routes your signal into the video system, and manages switching throughout your program.
- Client-supplied device playback is available on the interior **Stage Right, Stage Left, IMAG** screens; exterior programming runs on the **Arch screen** only.
- Keep the device with a dedicated operator during the program — it must remain connected, powered, and awake.
